                                                                                               2 DNA sequences (AAT62509 and AAT62510) respectively code for primatised forms (AAW01817 and AAW01818) of the light and heavy chain of cynomologue (AAW01817 and AAW01818) of the light and heavy chain compains monkey anti-human B7. artigen monoclonal antibody 7C10. Cloned 7C10 light and heavy variable genes are inserted into heavy chain constant region of NEOSFLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7B6 and 16C10 anti-B7. I antibody shave also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders
                                                  for treating autoimmune disease or graft-versus-host disease

Hanna N;

97WO-US19906 96US-0746361 This sequence encodes a primatized form of the

from macaque. This sequence is used in a method which studies new conclored antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28 Such Mab's are specific immunosuppressants for treatment of diseases involving of T cell'B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins induces long-term antigen-specific immunosuppression, i.e. it inhibits production of interleukin. 2 (IL-2), T cell proliferation and inhibits antigen-specific immunoglobulin G (IgG) responses. antibody 7C10 heavy chain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO200189567-A1
                                                                                                                         12-MAR-2002
```

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is conservation to the apoptosis of B7+ cells. The invention is a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell lymphoma, B cell lymphoma, B cell lymphoma, a systemic lupus, erythematosus, cidiopathic thrombocytopenia purpura, systemic lupus, erythematosus, cidiopathic thrombocytopenia purpura, systemic lupus, erythematosus, crype I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allersy, multiple sclerosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive disease and ulcerative colitis, food-related allergies e.g. magraine, chinitis and eczema, and other types of allergies. The present nucleic solitis collision of inhibit production of the collision of inhibit production of interleukin-2 (IL-2)

Cloned 16C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7C10 and 7B6 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, maxing them useful immunosuppressants for the treatment of autoimmune disorders

This sequence encodes a primatized form of the antibody 16C10 heavy chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (MAb's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MAb's are specific immunosuppressants for treatment of diseases involving to cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, theumatory bowel disease, allergy and multiple sclerosis, graft vs. Inflammatory bowel disease, allergy and multiple sclerosis, graft vs. con check of the properties of the stand of the properties of the stand of the stand of the same optionally combined with other proteins and induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and entigen-specific immunoslobulin G (IgG) responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is cancer treating diseases auch as B cell cancer, lymphoma, a cancer where B cells promote the growth and/or metastasis of tumours, C cancer where B cells promote the growth and/or metastasis of tumours, C cancer where B cells promote the growth and/or metastasis of tumours, C cancer where B cells promote the growth and/or metastasis of tumours, C type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple solarosis or graft-vs-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative airways disease, intestinal inflammations and allergies e.g. Crohn's calrays disease, intestinal inflammations and allergies e.g. migraine, confinitis and eczema, and other types of allergies. The present nucleic acid sequence encodes the heavy chain of 16Cl0, a primatised antibody incolinitis. Incolinitis and inhibit production of incolinitis. ö Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as GIGAAGCIGCAGCAGGGGGGAAAGGACTICTGCAGCCTITCGGAGACCCTGICCCGCACC 120 120 180 240 240 0; Gaps 9 1 ATGAAACACCTGTGGTTCTTCCTCCTCGTGGCAGCTCCCAGATGGGTCCTGTCCCAG TGCGTTGTCTCTGGTGGCTTCAGCGGTTACTACTGGACCTGGATCCGCCAGACC CCAGGGAGGGACTGGAGTGGCCATATTTATGGTAATGGTGCGACCACCAACTAC dráckácháckásáktrasásákorasataskáskornosakakorononosak TGCGCTGTCTCTGGTGGCTCCATCAGCGGTGATGGCTGGGGCTGGATCCGCCAGCCC 91.9%; Score 1115.8; DB 24; Length 1431; 95.0%; Pred. This sequence is expressed in several libraries, generally those associated with cancer, cell proliferation, immune response or trauma. The present sequence is useful in the diagnosis, treatment and prevention of disorders associated with the immune system and

These sequences were amplified using the sequences given in AAT18040-58. The monoclonal antibody may be used in the diagnosis of hCMV.

or a can be New human immune system associated proteins (HISAP) and polynucleotides encoding the HISAP, useful for diagnosing, treating or preventing immune or cell proliferative disorders or infections The present invention provides the coding and protein sequences for a number of human immune system associated proteins (HISAPs). These can used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atherosclerosis, system associated protein; HISAP-4; immune disorder; Human immune system associated protein HISAP-4 coding sequence.                                                                                                                                                          The human monoclonal antibody D7C2, of isotype 1gM, recognises a 30-32 kD polypeptide on the membrane of rhesus positive red blood cells. The antibody agglutinates rhesus positive cells but not rhesus negative cells and is useful diagnostically and also for preventing haemolysis in new-born rhesus positive babies. Recombinant IgM-D7C2 can be produced by insect cells which have been transformed by a baculoviral vector comprising a D7C2 expression cassette. The present sequence encodes a recombinant IgM-D7C2 heavy chain fused to a mouse VH signal peptide.

DNA sequences (AAT62868-70) respectively code for the heavy chain regions of human gamma-4 (AAM14925), gamma-4E carrying the L236E mutation (AAM14926) and gamma-4PE (AAM14927) carrying L236E and S229P mutations. They can be used to provide novel monoclonal and chimeric antibodies, e.g. CE9 gamma-4, CE9 gamma-4, E and CE9 gamma-4PE, in which the human IgG4 Fc binding domain framework is combined with the antigen binding domains (see also AAM14922-23) of macaque anti-human CD4 monoclonal antibody E9.1. These antibodies show high affinity to human CD4, have little or no immunogenicity in humans and show reduced or absence of effector function. The gamma-4E and -4PE mutations confer activity enhanced stability and eliminate depleting activity. The antibodies can be used to treat autoimmune diseases such as rheumatoid arthritis. Disclosure; Page 91-93; 155pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA sequences (AAT62868-70) respectively code for the heavy chain regions of human gamma-4 (AAM14925), gamma-4E carrying the L236E mutations.

mutations. They can be used to provide novel monoclonal and chimeric antibodies, e.g. CE9 gamma-4F. (DE9 gamma-4F and CE9 gamma-4F, in which the human IgG4 FC binding domain framework is combined with the antigen binding domains (see also AAM14922-23) of macaque anti-human CD4 monoclonal antibody E9-1. These antibodies show high affinity to human CD4, have little or no immunogenicity in humans and show reduced or absence of effector function. The gamma-4B and -4PE mutations confer activity enhanced stability and aliminate depleting activity. The antibodies can be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

The present sequence encodes a single chain antibody of the invention. The specification describes a substance can inhibit the binding between hepatitis C virus (HCV) and cells with potential HCV infection, cells with expression of CD81, or CD81. This substance is especially an antibody with affinity towards HCV BZ/NS1 protein, containing amino acid sequences based on the complementarity determining region (CDR) 1, CDR2 and CDR3 of the H and L chain variable regions. The antibody inhibits the viral envelope GJycoprotein. It is also a CD81 inhibitor. The antibodies and drugs are used for treatment and/or prevention of hepatitis C, or for diagnosis of hepatitis C.

RF1 is a human monoclonal antibody (hMAb) specific for the fusion protein of respiratory syncytial virus (RSV). The DNA sequence, in vector NBC9EPA, can be used to produce the light chain construct in transfected eukaryotic (e.g. (CHO) cells. RF-1 and RF-2 heavy and light chain constructs (see also AAT61240, AAT61242, AAT61279) are
                                                                                                                                                                                      1320
